

3M™ Wetordry™ Rubber Squeegee is made from flexible, sturdy rubber, ideal for removing sludge created when sanding or for applying glazing putty and plastic filler to repair surfaces. Our squeegee wipes away excess material so that you can get a better view of the work surface. It also helps smooth body filler and glazing putty that is being applied.

Dual Purpose Squeegee and Filler Smoother

As sanding swarf, sludge and water accumulate, our 3M™ Wetordry™ Rubber Squeegee hugs the surface to wipe away the material that obscures your view of how the work is progressing. The squeegee is sturdy enough to plow through sludge, yet soft and flexible enough to be gentle on the surface. The same attributes make it a perfect choice for applying body filler and glazing putty. The squeegee smooths [filler](#) and [putty](#) to be even with the surrounding surface for professional quality automotive restoration.

Designed for Convenience and Control

At 2" x 3", our rubber squeegee is sized to fit comfortably in most hands. You may also use it as a block for smaller pieces of sandpaper. With the squeegee, you'll have better control of the work being done, whether that is removing swarf and water or applying filler and glazing putty.
