All the facts, right in the field

With its precision, reliability and ease of use, the Fluke 3000 FC Wireless Multimeter is the ideal solution for professional technicians. Independently tested for safe use in CAT IV 600V/ CAT III 1000 V environments, the Fluke 3000 FC has all the features you need to troubleshoot and repair many problems in electrical and electronic systems.

All the most important measurements

The Fluke 3000 FC gives you true-rms voltage and current measurements, 6000-count resolution, manual and automatic ranging and provide frequency, capacitance, resistance, continuity and diode measurements. In addition, the Fluke 3000 FC provides higher 0.09 % basic accuracy, a digital display showing up to three secondary measurements from remote modules, and a bright white backlight.

Work safely near electrical panels while wearing less PPE

The Fluke 3000 FC True-rms Wireless Multimeter and Fluke Connect wireless test tools put tools, not your body, near live electrical panels. It's simple. Just de-energize the cabinet, open the panel while wearing PPE and connect the remote modules, whether they are voltage modules, current clamps, flexible current loops or thermometers. Then read the results on the 3000 FC Wireless Multimeter from a safe distance. You can display the meter measurement, plus readings from up to three wireless modules, while reducing the risk of arc flash by separating yourself from hazardous measurement situations.

Better still, the Fluke 3000 FC Series Wireless Multimeter can send measurement data to your smartphone, so you can save and share measurements from the field with your team anytime, from anywhere*.

Don't get bogged down while chasing interrelated events

When trying to find the cause of a complex problem, you often need to make a measurement in one place and see activity on a different part of the system at the same time. We've solved that problem with Fluke Connect—connect your remote modules in one location, then take your measurements up to 20 meters away with the Fluke 3000 FC multimeter. You'll be able to see the interaction between your remote test points on one single screen, in real time. You can even download the data to a PC for further analysis.

Calibration Information

Maintenance

Maintenance of the Meter consists of battery and fuse replacement, as well as case cleaning.

Fuse Test (115, 117)

To test the fuse:

1. Set the rotary switch to Ω .
2. Plug a test lead into the $\frac{V}{\Omega}$ jack and touch the probe to the 10A jack, as shown in Figure 1.

If the display shows a resistance value in the range of that shown in Figure 1, the fuse is good.

If the display reads ∞ , replace the fuse and test again.

If the display shows any other value, have the Meter serviced. See *How to Contact Fluke* earlier in this document.

Figure 1. Test the Fuse

Battery and Fuse Replacement

⚠⚠ Warning

To prevent shock, injury, or damage to the Meter:

- Remove test leads from the Meter before opening the case or battery door.
- Use ONLY a fuse with the amperage, interrupt voltage, and speed ratings specified.

Static Awareness

Semiconductors and integrated circuits can be damaged by electrostatic discharge during handling. This notice explains how to minimize damage to these components.

1. Understand the problem.
2. Learn the guidelines for proper handling.
3. Use the proper procedures, packaging, and bench techniques.

Follow these practices to minimize damage to static sensitive parts.

⚠⚠ Warning

To prevent electric shock or personal injury.
De-energize the product and all active circuits
before opening a product enclosure, touching or
handling any PCBs or components.

- Minimize handling.
- Handle static-sensitive parts by non-conductive edges.
- Do not slide static-sensitive components over any surface.
- When removing plug-in assemblies, handle only by non-conductive edges.
- Never touch open-edge connectors except at a static-free work station.

- Keep parts in the original containers until ready for use.
- Use static shielding containers for handling and transport.
- Avoid plastic, vinyl, and Styrofoam® in the work area.

- Handle static-sensitive parts only at a static-free work station.
- Put shorting strips on the edge of the connector to help protect installed static-sensitive parts.
- Use anti-static type solder extraction tools only.
- Use grounded-tip soldering irons only.

See Figure 2 for disassembly.

Figure 2. Disassembly

To remove the battery door for battery replacement:

1. Remove the test leads from the Meter.
2. Remove the battery door screw.
3. Use the finger recess to lift the door slightly.
4. Lift the door straight up to separate it from the case.
5. The battery fits inside the battery door, which is then inserted into the case, bottom edge first, until it is fully seated. Do not attempt to install the battery directly into the case.
6. Install and tighten battery door screw.

To open the case for fuse replacement:

1. Remove the test leads from the Meter.
2. Remove the Meter from its holster.
3. Remove two screws from the case bottom.
4. Separate the case bottom from the case top.
5. Remove the fuse from its holder and replace it with an 11 A, 1000 V, FAST fuse having a minimum interrupt rating of 17 000 A. Use only Fluke PN 803293.
6. To re-assemble the Meter, first attach the case bottom to the case top, then install the two screws. Finally, insert the Meter into its holster.

Cleaning

Wipe the case with a damp cloth and mild detergent. Dirt or moisture in the terminals can affect readings.

Preparing for the Performance Tests

⚠⚠ Warning

To prevent possible electric shock or personal injury:

- Do not perform the following procedures unless qualified to do so. Some procedures involve the use of high voltages.
- Before handling the test connections and in between tests, make sure the calibrator is in standby mode (STBY).

To prepare for the performance test:

1. Make sure that you have the required equipment (see Table 2).
2. Warm up the calibrator as required by its specifications.
3. Allow the temperature of the DUT to stabilize at room temperature: 23 °C ±5 °C (73 °F ±9 °F)
4. Check the fuses and battery and replace them if necessary. See *Fuse Test (115, 117)* and *Battery and Fuse Replacement*.

To verify the accuracy of the DMM functions, do the following:

1. Connect the Calibrator to the **VΩ** and **COM** input terminals on the Meter.
2. Turn the rotary switch to the function listed in each step of Table 3 (110, 114, 115, 116, 117) or Table 4 (113).
3. Apply the input level for each step listed in Table 3 (110, 114, 115, 116, 117) or Table 4 (113).
4. Compare the reading on the Meter display with the Display Reading in Table 3 (110, 114, 115, 116, 117) or Table 4 (113).

If the display reading falls outside of the range shown, the Meter requires calibration adjustment or repair.

Testing Temperature (116 only)

Connect the K-type thermocouple to the temperature input of the Meter and temperature calibrator. To ensure an accurate measurement, the Meter and the thermocouple connector must be at the same temperature. After connecting the thermocouple to the Meter, allow the junctions to stabilize before recording the displayed reading. This can take several minutes, depending on temperature gradients.

Testing the VoltAlert Function (117 only)

Use this procedure to verify that VoltAlert functions properly.

Note

- Make sure the instrument is REMOVED from the holster before you do the test.
- Keep the Meter away from electrical noise sources during the tests, for example, florescent lights, dimming lights, and motors. These types of noise source can trigger VoltAlert and invalidate the test.
- It may be necessary in steps 4 and 8 below to slightly adjust the Meter position for maximum signal strength to get the Meter beeper to sound continuously.

Refer to Figure 4 for these steps:

1. Select the VoltAlert function and verify that **Hi** is on the display. Verify that the beeper is silent and the red LED is off.
2. Connect a double banana plug to the output voltage terminals of the calibrator (Fluke 5500A or equivalent).
3. Set the calibrator output to 10 V at 60 Hz.
4. Hold the Meter so that the top is vertically and horizontally centered and contacting the banana plug Hi terminal. Verify that the Meter beeper is on continuously and the red LED at the top of the display lights.
5. Place the calibrator in standby mode and verify that the beeper is now silent and the red LED is off.
6. Press **RANGE** (display should indicate **Lo** range).
7. Set the calibrator output to 30 V at 60 Hz.

Figure 4. VoltAlert Test

8. Hold the Meter so that the top is vertically and horizontally centered to the banana plug Hi terminal. Verify that the Meter beeper is sounding continuously and the red LED at the top of the display lights.
9. Return the calibrator to standby mode and verify the Meter beeper is silent and the red LED is off.

For Fluke 117 with S/N 38920290 through 42913406, use this alternate calibration procedure to verify that VoltAlert functions properly. See Figure 5.

1. Select the VoltAlert function:
 - a. Verify that **H** is on the display.
 - b. Verify that the beeper is silent and the red LED is off.
2. Connect wire (Pomona 4911A-12-2 or equivalent) to the High output voltage terminals of the calibrator (Fluke 5500A or equivalent).
3. Set the calibrator output to 10 V at 60 Hz.
4. Hold the Meter so that the wire contacts and runs across the top center of the unit. The wire should run perpendicular to the face of the unit (front to back of Meter, not side to side). Verify that the Meter beeper is on continuously and the red LED, at the top of the display, lights up.
5. Place the calibrator in standby mode and verify that the beeper is silent and the red LED is off.
6. Press **RANGE**.

Display should indicate **L0** range.
7. Set the calibrator output to 30 V at 60 Hz.
8. Hold the Meter so that the wire contacts and runs across the top center of the unit. The wire should run perpendicular to the face of the unit (front to back of Meter, not side to side). Verify that the Meter beeper is on continuously and the red LED, at the top of the display, lights up.
9. Return the calibrator to standby mode and verify the Meter's beeper is silent and the red LED is off.

Figure 5. Volt Alert Test (Alternate)

Calibration Adjustment

The Meter features closed-case calibration adjustment using known reference sources. The Meter measures the applied reference source, calculates correction factors, and stores the correction factors in nonvolatile memory. The following sections present the features and Meter pushbutton functions available during the Calibration Adjustment Procedure. Should the Meter fail any of the performance tests, perform the Calibration Adjustment Procedure.

110/114/115/116/117

Use these steps to view the Meter calibration counter:

1. While pressing **HOLD**, turn the rotary switch from **OFF** to Ω function. The Meter should display ζRL .
2. Press once to view the calibration counter. For example, $n00 l$.
3. Turn the rotary switch to **OFF**.

1. While pressing **RANGE**, turn the rotary switch from **OFF** to Ω function. The Meter should display ζRL .
2. Press once to view the calibration counter. For example, $n00 l$.
3. Turn the rotary switch to **OFF**.

Calibration Adjustment Password

To start the Calibration Adjustment Procedure, the correct 4-digit password must be entered. The default password is $l234$. The password can be changed or reset to the default as described in following paragraphs.

Changing the Password

Use these steps to change the Meter password:

1. **110/114/115/116/117:**

While pressing **HOLD**, turn the rotary switch from **OFF** to Ω function.

113:

While pressing **RANGE**, turn the rotary switch from **OFF** to Ω function.

The Meter should display ζRL .

2. Press once to see the calibration counter.
3. Press again to start the password entry.

The Meter displays $????$.

The Meter buttons indicated below represent the numbers 1 through 5 when you enter or change the password:

HOLD = 1 **MIN MAX** = 2 **RANGE** = 3 = 4 \oplus = 5

4. Press 4 buttons to enter the current password. To change the password for the first time, enter **HOLD** (1), **MIN MAX** (2), **RANGE** (3), and (4).
5. Press **RANGE** to change the password.
The Meter displays $----$ if the entered password is correct. If the password is not correct, the Meter emits a double beep, displays $????$, and the password must be entered again. Repeat step 4.
6. Press the 4 buttons of the new password.
7. Press to store the new password.

Restoring the Default Password

If the calibration password is forgotten, the default password (1234) can be manually restored:

⚠⚠ Warning

To prevent electric shock or personal injury, remove the test leads and any input signal before removing the Meter's back case.

1. Remove the Meter back case. Leave the PCA in the top case.
2. Apply 9.0 V across the battery contacts (XBT1) + and (XBT2) – on the back of the PCA. See Figure 6.
3. Turn the rotary switch from **OFF** to any **ON** position.
4. Short across the S7 CAL keypad on the back of the PCA. See Figure 6. The Meter should beep. The default password is now restored.
5. Remove the 9.0 V supply and replace the Meter back case.

Meter Buttons Used in the Calibration Steps

For the Calibration Adjustment Procedure, the Meter buttons behave as follows:

- Press and hold **HOLD** to show the measured value. The measured value is not calibrated so it may not match the input value. This is normal.
- Press and hold **MIN MAX** to display the required input value.
- Press to store the calibration value and advance to the next step. This button is also used to exit calibration mode after the calibration adjustment sequence is complete.
- Press  to toggle the backlight on and off.

This can be useful to determine why a calibration step is not accepted and to determine the input value without referring to Table 5.

Calibration Adjustment Procedure

Note

If you turn off the Meter before completion of the adjustment procedure, the calibration constants do not change.

To adjust the Meter calibration:

1. **110/114/115/116/117:**

While pressing **HOLD**, turn the rotary switch from **OFF** to Ω function.

113:

While pressing RANGE, turn the rotary switch from **OFF** to Ω function.

The Meter should display $\frac{f}{RL}$.

2. Press once to see the calibration counter.

3. Press again to start the password entry.

The Meter displays $\overline{P}P\overline{P}P$.

4. Press the 4-button password.

5. Press to go to the first calibration step. The Meter displays [] if the password is correct. If the password is not correct, the Meter emits a double beep, displays $\overline{P}P\overline{P}P$ and the password must be entered again. Repeat step 4.

6. Apply the input value listed for each calibration adjustment step. For each step, select the rotary switch position and apply the input to the terminals as indicated in Table 5 and Table 6.

Note

Some adjustment steps require additional wait time after the calibrator settles, as noted in Table 5 and Table 6.

7. After each input value is applied, press to accept the value and proceed to the next step ($\overline{L}00\overline{P}$).

Note

After you press , wait until the step number advances before you change the calibrator source or turn the rotary switch. Some adjustment steps can take up to several seconds to execute before the next step.

If the rotary switch is not in the correct position for a given step, the meter will flash the unit annunciators until the rotary switch is put in a valid position. The keys that show the reading and required input values are not allowed until the rotary switch is correct.

If the rotary switch is not in the correct position or the measured value is not within the anticipated range of the input value, the Meter will emit a double beep and will not continue to the next step when you press .

After the final step, the display shows End to indicate that the calibration adjustment is complete.

8. Press to return to meter mode.

Note

Set the calibrator to Standby before you change the function switch position and after you complete adjustment of each function.

If the calibration adjustment procedure is not properly completed, the Meter will not operate correctly.
